Endo-ERN

Do not forget salivary cortisol!!!!!!!!!!!!!!

Overnight 1-mg DST

PROs

- Large studies
- Subclinical hypercortisolism

CONs

- DEX absorption and metabolism (P450 enzyme system)
- Patient instruction
- Poor sleep, aging
- Cortisol assays

LNSC

PROs

- Stress-free & outpatient
- Easy to use
- Elevated diagnostic accuracy
- Cyclical, recurrent CS/CD

CONs

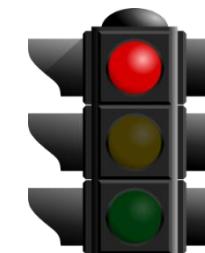

- Immunoassays → validation
- Acid or sugar Food, licorice, smoke
- Oral GC
- Lack of widespread use

UFC

PROs

- 24h integrated measurement
- Free hormone
- Used in many centers

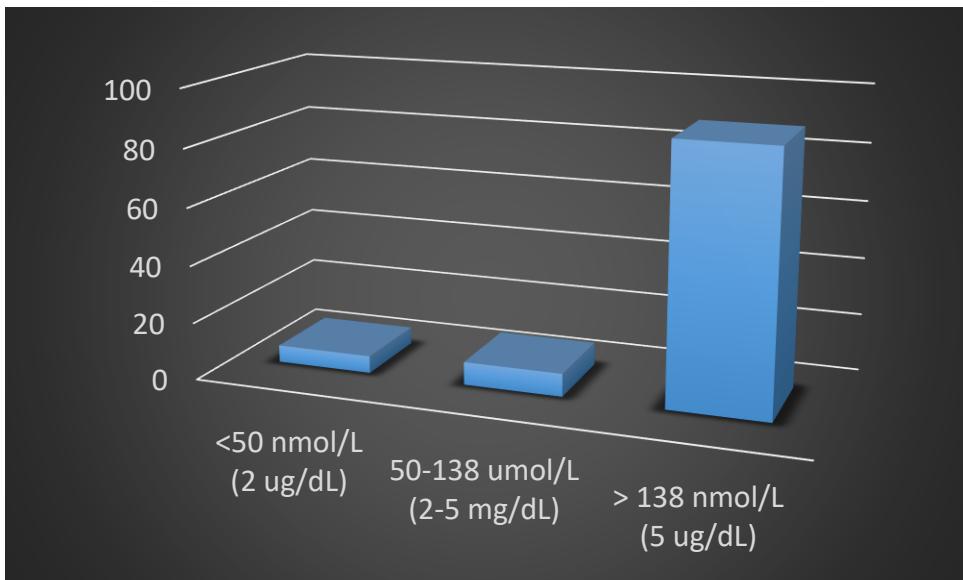

CONs

- 24 h collections
- ! Renal function
- Day to day variability
- Assay (RIA and ELISA)

DST: rischio di falsi negativi

The Low-Dose Dexamethasone Suppression Test: A Reevaluation in Patients with Cushing's Syndrome

103 CS

DST open issues

- Dexamethasone metabolism
- Adrenal incidentaloma (up to 8-10% of population)
→ threshold 138 nmol/L to consider autonomous cortisol secretion

14 patients cortisol after 1 mg DST < 138 nmol/L

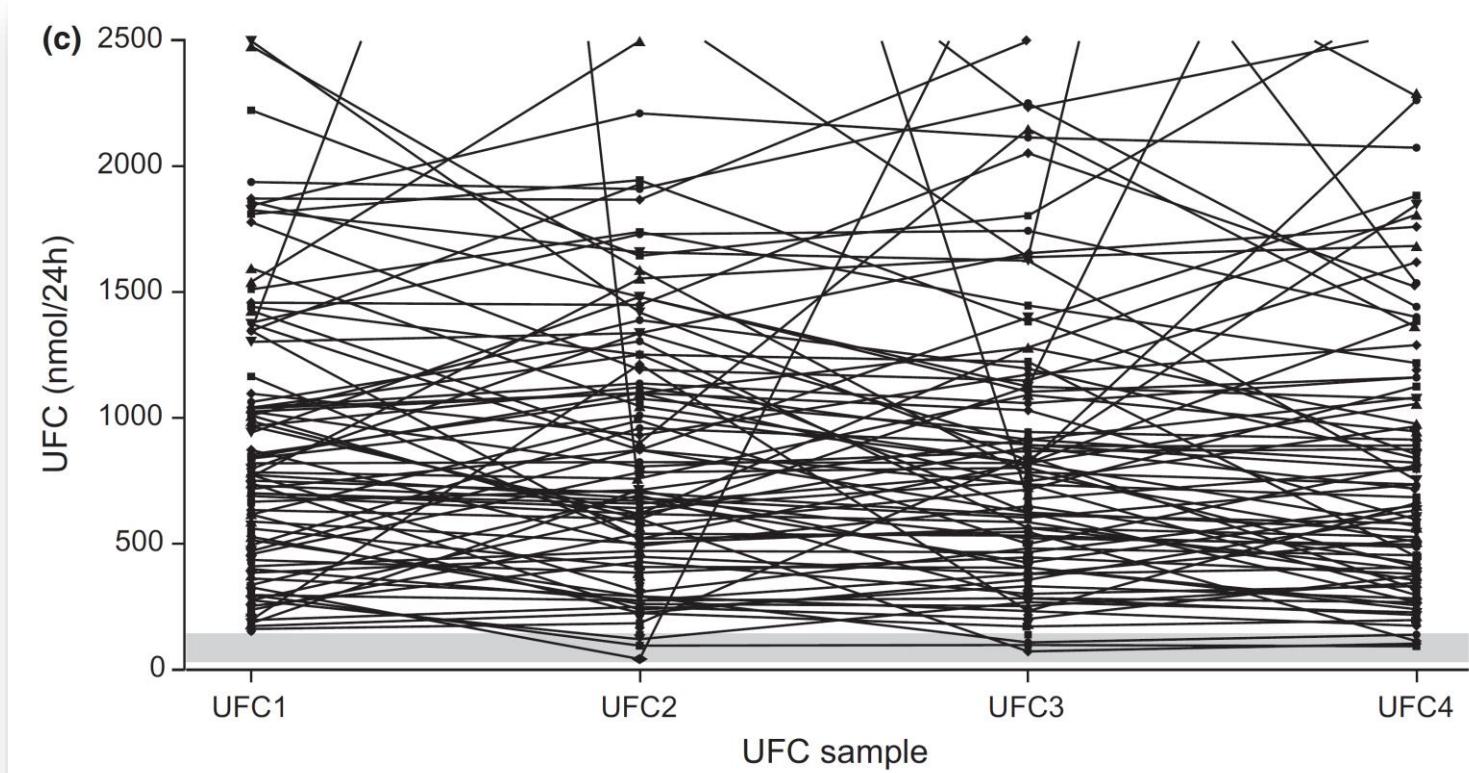

6 patients cortisol after 1 mg DST < 50 nmol/L → BUT positive ACTH pituitary adenoma!!!!!!!!!!!!!!

UFC: ampia variabilità → rischio falsi negativi

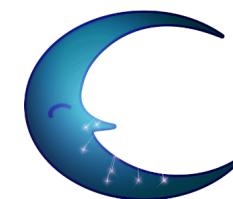

High variability in baseline urinary free cortisol values in patients with Cushing's disease

- 152 with persistent/recurrent or de novo CD
- mean UFC ≥ 1.5 ULN
- 4 baseline urine collections

7 patients with at least 1 normal UFC (but mean > 1.5 UFC)

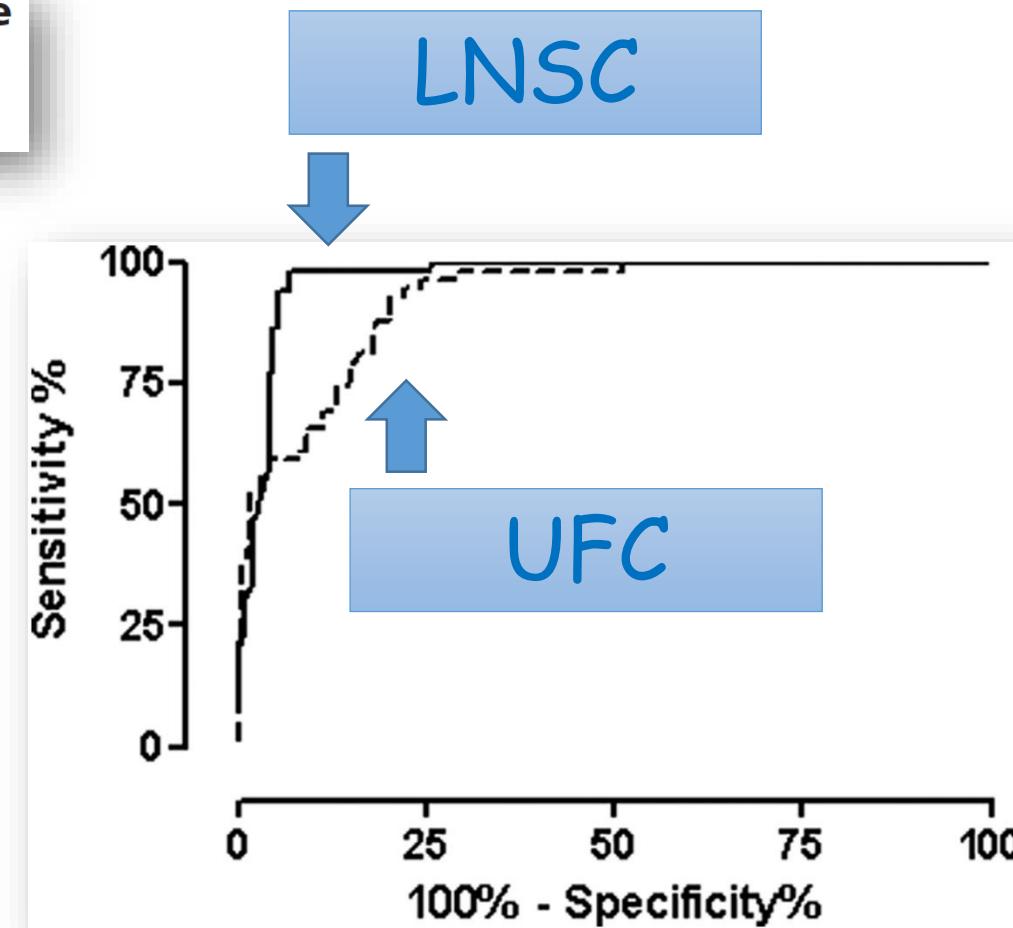

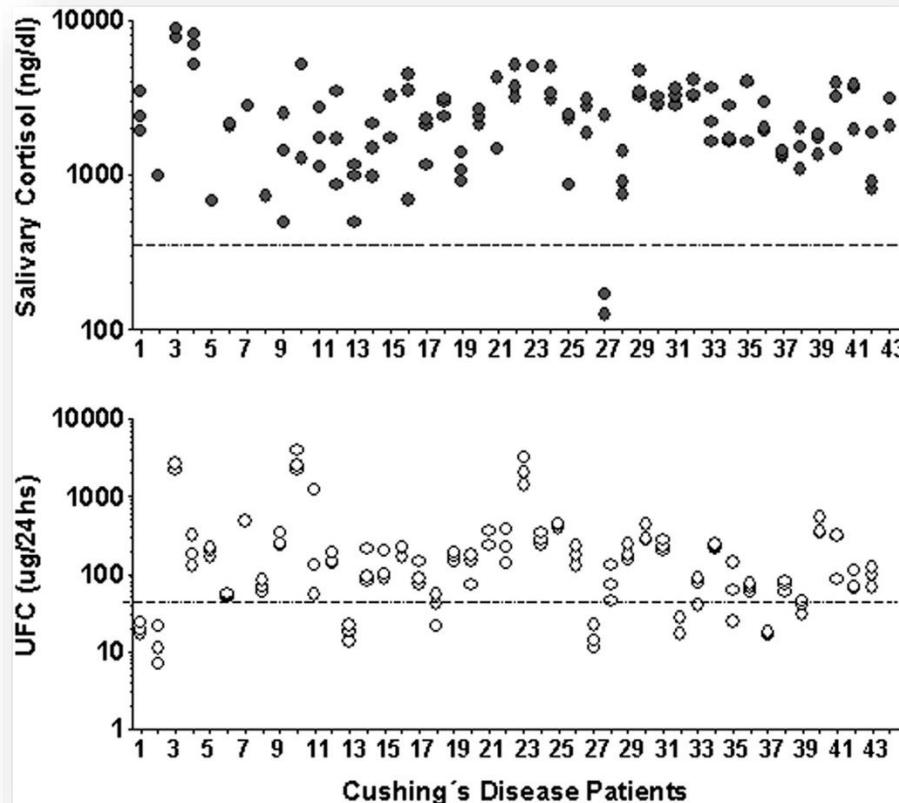

LNSC vs UFC

Late-night Salivary Cortisol Has a Better Performance Than Urinary Free Cortisol in the Diagnosis of Cushing's Syndrome

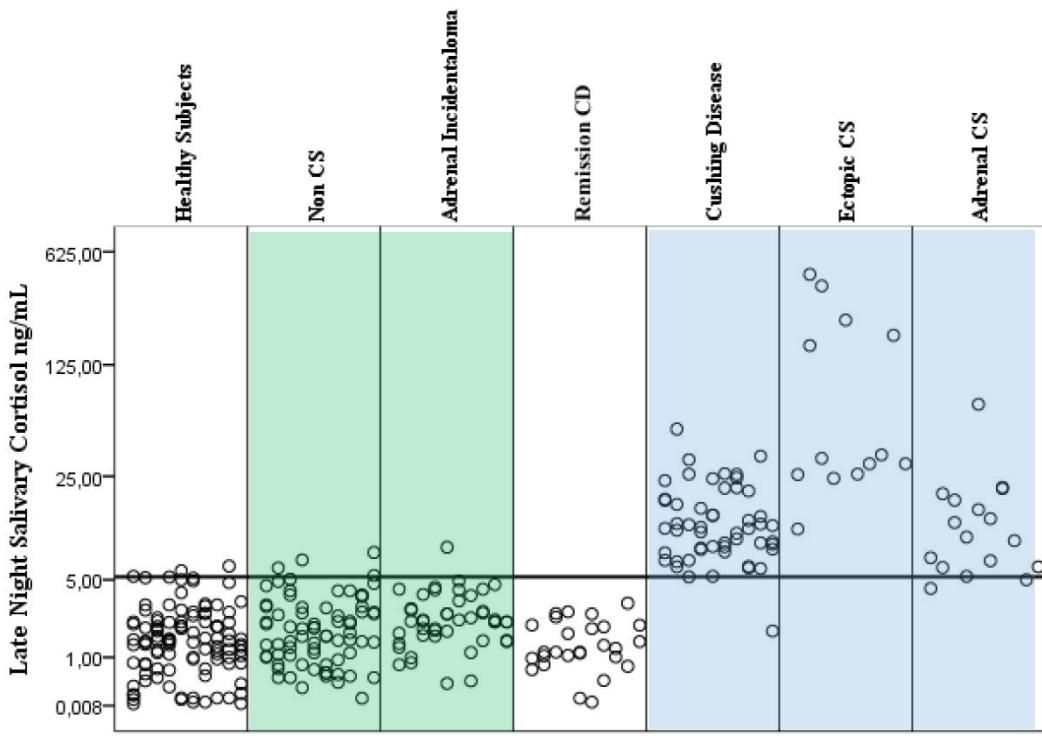

• 52 CS
• 18 obese

LNSC: evidence

Performance of salivary cortisol in the diagnosis of Cushing's syndrome, adrenal incidentaloma, and adrenal insufficiency

- 104 healthy controls
- 73 suspected CS
- 27 remission CS
- 45 non cortisol secreting adrenal adenoma
- 82 CS

Population	LNSC ng/mL	SE %	SP %	AUC
CS vs healthy subjects	5.24	96.3	97.1	0.992
CD vs healthy subjects	5.24	98.1	97.1	0.991
CS vs non-CS	5.15	96.3	94.5	0.986
CD vs non-CS	5.15	98.1	96.5	0.984
CD recurrence vs non-CS	5.15	100	95.5	0.987
CS vs adrenal incidentaloma	4.95	97.6	97.8	0.985

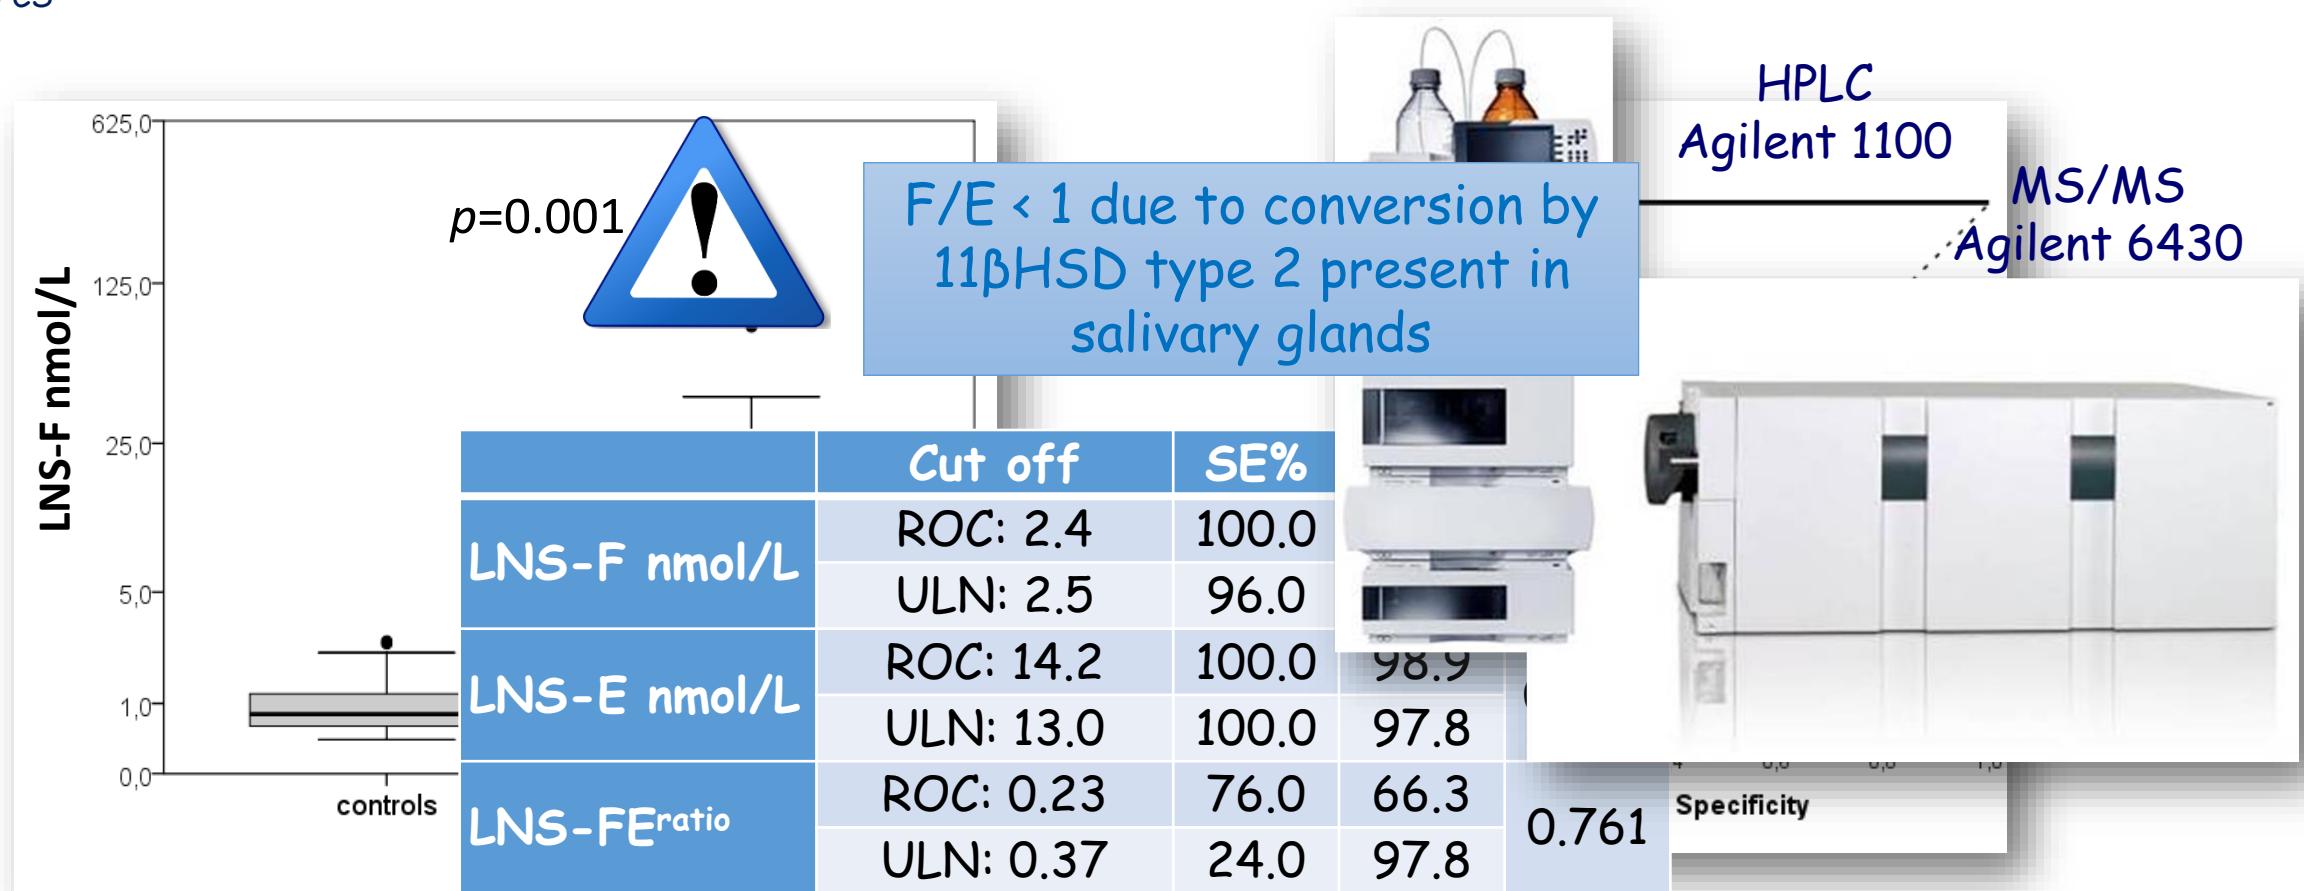

RIA assay!

LNSC: evidence

Salivary cortisol and cortisone by LC-MS/MS: validation, reference intervals and diagnostic accuracy in Cushing's syndrome

- 91 healthy controls
- 25 CS

UFC: evidence (still?)

Is urinary free cortisol of value in the diagnosis of Cushing's syndrome?

- + methodological difficulties in 24-h urine collection
- + assay precision
- + increased prevalence of mild, preclinical or cyclic CS + SE and SP UFC are less than ideal

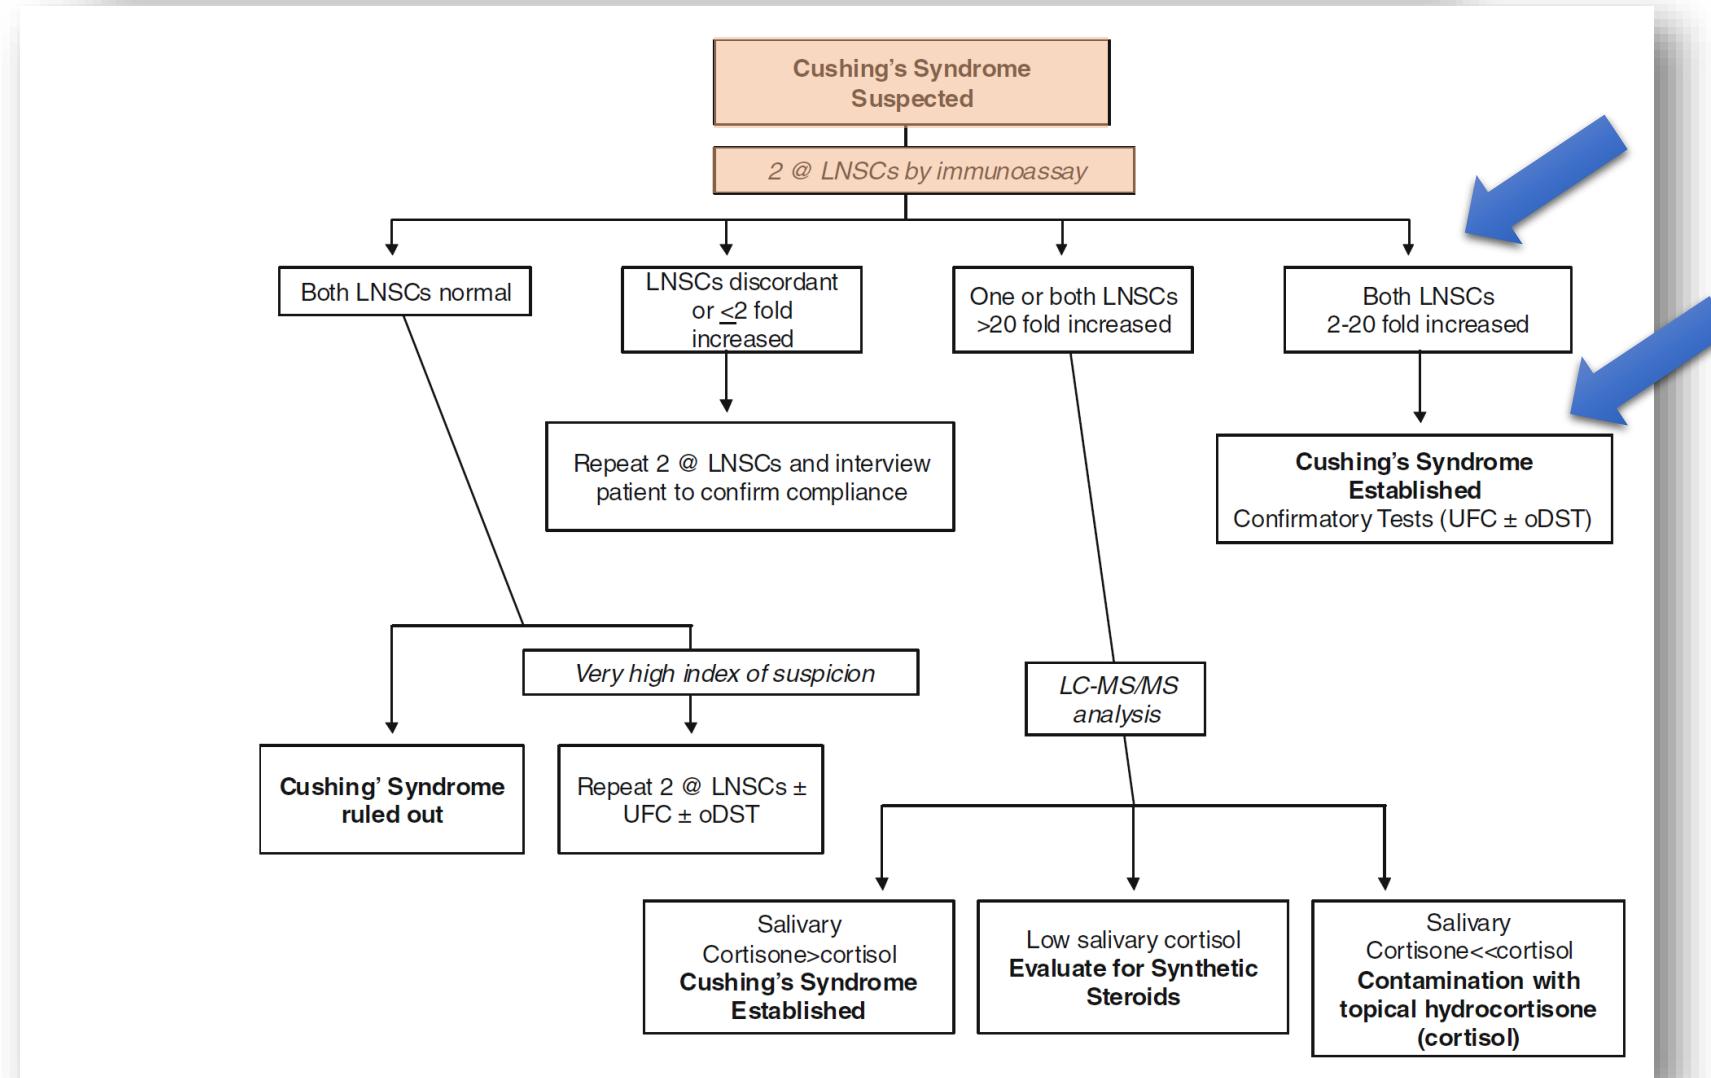

= we suggest the use of other more novel tests (LNSC)

Urine Free Cortisol in the Diagnosis of Cushing's Syndrome: Is It Worth Doing and, If So, How?

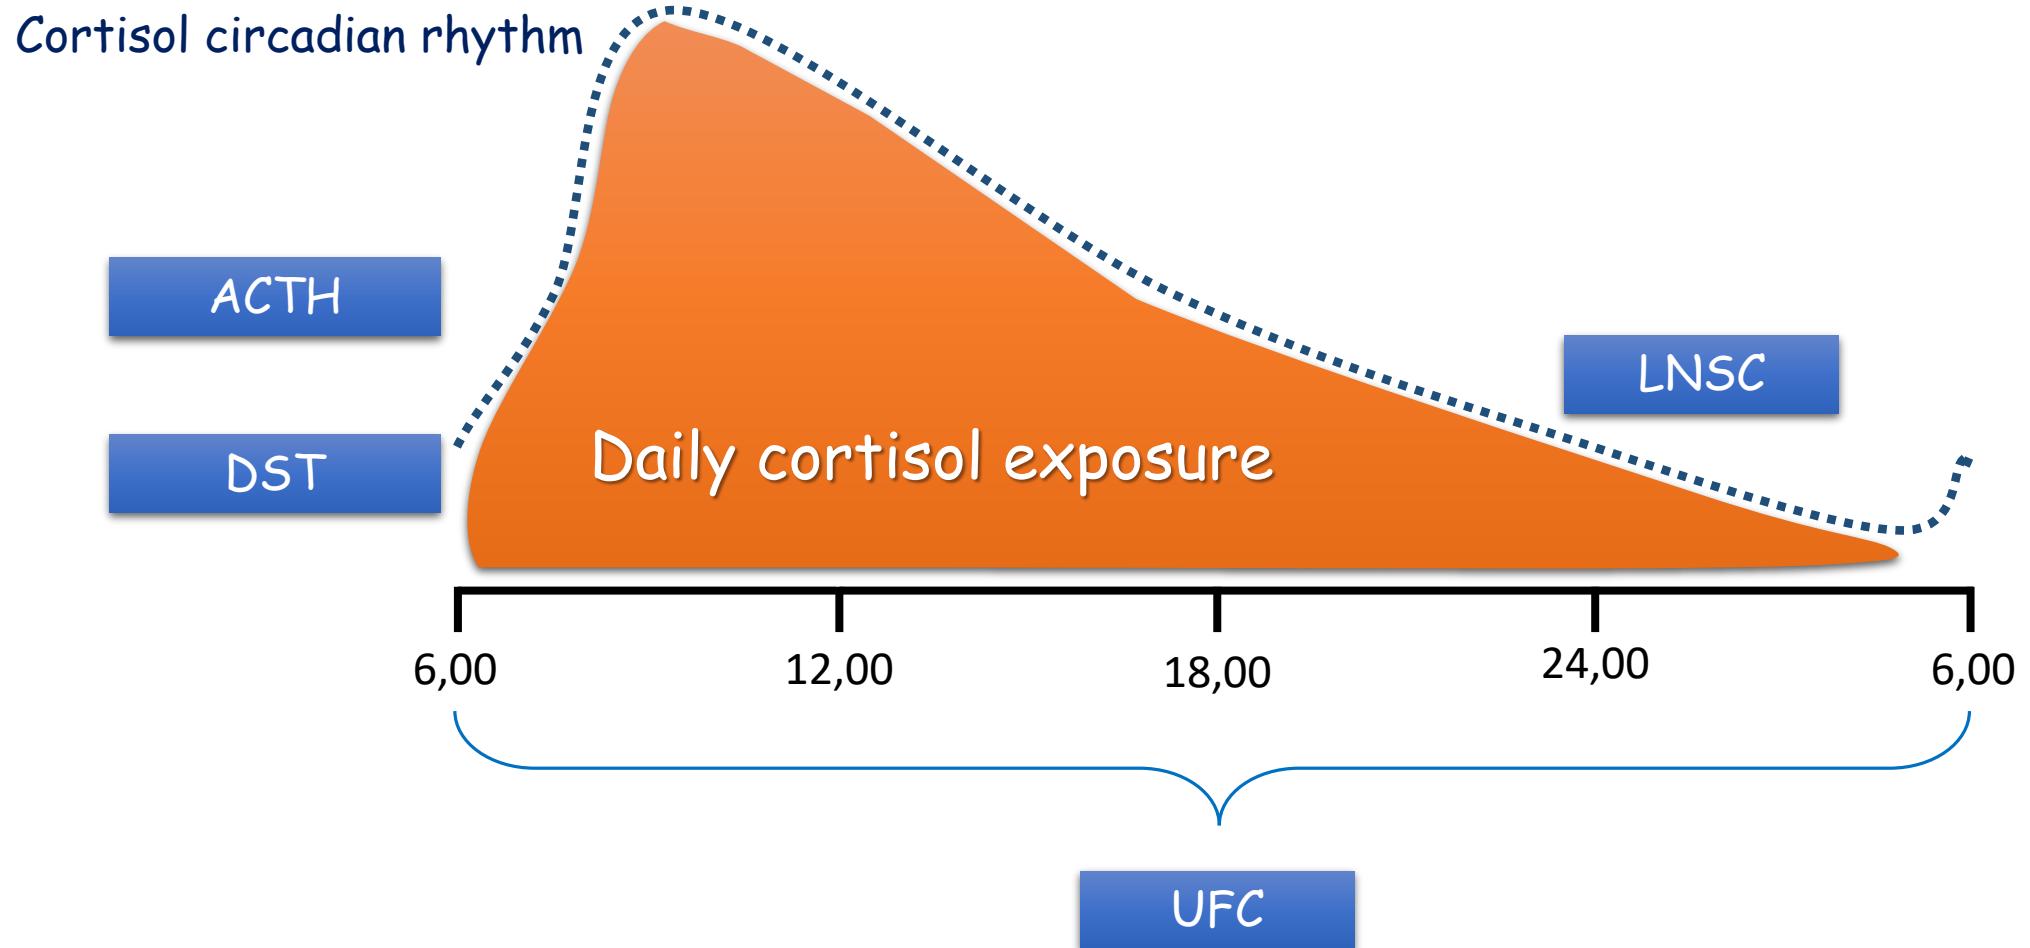

1ST QUESTION: does the measurement of UFC have adequate diagnostic sensitivity and specificity to be a useful test?

Only in hypercortisolism, since free cortisol appears in urine only when its concentration exceeds the binding capacity of CBG and albumin

Cushing's syndrome: diagnosis and surveillance cortisol

Is there something new?

Ruolo “Complementare” dei tests di screening nel sospetto di CS

➤ GRAVIDANZA/ EstroProgestinici

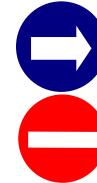

**UFC, cortisolo salivare notturno
DST test**

➤ TERAPIA ANTI-EPILETTICA

**UFC,Cortisol salivare notturno,
DST test**

➤ INSUFFICIENZA RENALE

**Cortisol salivare notturno
UFC, DST test**

➤ S. CUSHING ciclica o
recidiva CD

**Cortisol salivare notturno
DST test**

➤ INCIDENTALOMA

A large central graphic featuring the words "thank you" in various languages (including English, German, French, Spanish, Italian, Portuguese, Dutch, Swedish, Polish, Russian, Chinese, Japanese, Korean, Thai, Vietnamese, etc.) in different colors and fonts. The graphic is surrounded by small portraits of the participants.

Gianluca Occhi

Andrea Daniele

Open issues

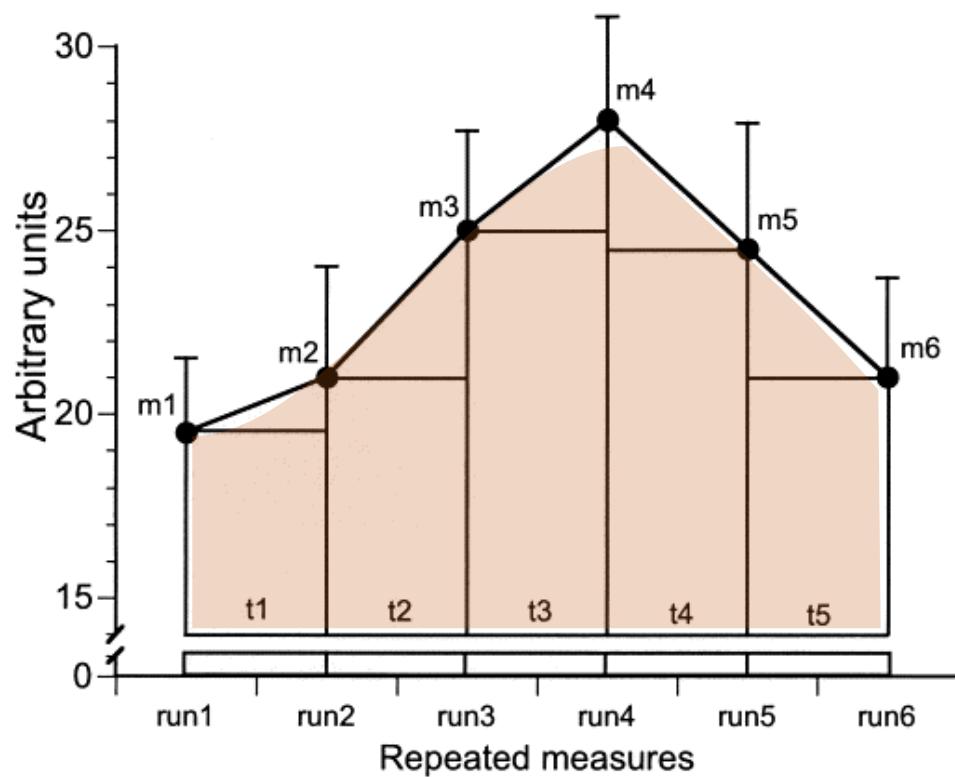

- LNSC: 1 or 2 collections?
- High clinical suspicion and normal LNSC: repeat LNSC or use other tests?
- Elevated LNSC (2-20 times ULN): sufficient for CS diagnosis ? Other tests to confirm?
- 2 LNSC discordant determinations: what we have to do?
- Possible LNSC contamination if LNSC >20 ULN ? Which other study?
- Immunoassay or MS/MS? Is it necessary only one, are necessary both?

Daily (salivary) cortisol exposure

Daily
cortisol
exposure

AUC (area under the curve) of
salivary cortisol concentration
from the 6 collections

$$AUC_G = \sum_{i=1}^{n-1} \frac{(m_{(i+1)} + m_i)}{2}$$
